- Practical case demonstration
- Results
- Conclusions

## Model Code 2010

- According to MC2010 the tensile behaviour and fracture mode I parameters are determined from the residual flexural strength parameters,  $f_{Rj}$ , obtained by performing three-point notched beam bending tests (3PNBBT)

$$f_{Rj} = \frac{3 \cdot F_j \cdot l}{2 \cdot b \cdot h_{sp}^2}$$

■ **Tensile constitutive Law**

- Simplified approach proposed by MC2010

- More accurate stress-crack width relationships for numerical analysis

$$f_{Ftu} = \frac{f_{R3}}{3}$$

$$f_{Fts} = 0.45 f_{R1}$$

$$f_{Ftu} = f_{Fts} - \frac{w_u}{CMOD_3} (f_{Fts} - 0.5 f_{R3} + 0.2 f_{R1}) \geq 0$$

Introduction

COFIT software

Practical case demonstration

Results

Conclusions

## Tensile constitutive Law

- Simplified approach proposed by MC2010

- More accurate stress-crack width relationships for numerical analysis

Inverse Analysis

▪ **Inverse analysis (IA) approaches**

• **Point-by-point approach**

- ✓ Each point in the s-w diagram is determined from the previous one
- ✓ No initial assumption about the s-w relationship is needed
- Prone to accumulation of errors

• **Global approach**

- ✓  $\sigma$ -w diagram is defined a-priori and its governing points modified
- ✓ Different  $\sigma$ -w relationships can be used (exponential, multilinear)
- Might lead to spurious solutions if the optimization is not boundary constrained

▪ **Inverse analysis (IA) approaches**

• **Point-by-point approach**

- ✓ Each point in the s-w diagram is determined from the previous one
- ✓ No initial assumption about the s-w relationship is needed
- Prone to accumulation of errors

• **Global approach**

- ✓  $\sigma$ -w diagram is defined a-priori and its governing points modified
- ✓ Different s-w relationships can be used (exponential, multilinear)
- Might lead to spurious solutions if the optimization is not boundary constrained

▪ **Inverse analysis (IA) approaches**

- Prone to accumulation of errors

• **Global approach**

- ✓  $\sigma$ -w diagram is defined a-priori and its governing points modified
- ✓ Different s-w relationships can be used (exponential, multilinear)
- Might lead to spurious solutions if the optimization is not boundary constrained

## 2. COFIT Software

## ■ Main features

 **2 problem types**

 **Include/exclude  $f_{ct}$  and/or  $E_c$  from the IA procedure**

 Possible implementation of additional models due to **modular architecture**

$f_x$  Numerical response based on **analytical models** reducing computational time

## Results

## 4. Conclusions

## 4. Conclusions

- **COFIT** is a **practical, efficient** and **robust** inverse analysis tool
- Results from **3PNBBT** and **RPT-3PS** can be used
- COFIT shows a **very good performance**, and the values obtained for the multi-linear softening diagrams were consistent with the material characteristics;
- Runtimes:
  - **3PNBBT** – 1 to 2 minutes;
  - **RPT-3PS** – 4 to 6 minutes;
- Results are **not affected** by the **initial values provided by the user**, demonstrating the robustness of the automatic variable updating procedure;
- **COFIT** proved to be **more accurate and faster** than **FEM**-based approaches.

A green-tinted photograph of a bird's nest built in a hole in a concrete wall. The nest is made of twigs and is positioned in the center of the frame. The background is a blurred indoor setting with vertical lines, possibly from a window or door. The text "Thank you for your attention!" is overlaid in white, bold font in the center of the image.

**Thank you for your attention!**
